Week Report 0

Summary of Presentation: Introduction to CIS 106

The presentation give us reasons as to why we should learn about linux.

- Linux is the Global Operation System that runs everywhere - servers, personal computers, smartphones, and embedded devices.
- It is a required skill by most Information Technology, Computer Science, and Information Systems careers.
- Linux is a open source/free software which means that you can read/improve/distribute source code, you can customize every part of it, and it respects your privacy.
- Since it is open source, it has a huge number of developers, thus leading vulnerabilities to being patched fast.
- Linux is one of the most stable operating systems in the planet; linux servers are known to run for years without needing a single reboot.
